-----	---	----	---	-------	---

## CWE-233: Improper Handling of Parameters

This concern about situation: software does not properly handle when the expected number of parameters, fields, or arguments is not provided in input, or if those parameters are undefined.

Scenario:

Method `com.thoughtworks.go.config.BackupConfig.hashCode()` stores return result in local before immediately returning it. It would be simpler just to return the value that is assigned to the local variable, directly.

`hashCode` method in

`BackupConfig.java` [<https://github.com/gocd/gocd/blob/master/config/config-api/src/main/java/com/thoughtworks/go/config/BackupConfig.java>

] stores return result in local before immediately returning it. Stores the return result in a local variable, and then immediately returns the local variable. It would be simpler just to return the value that is assigned to the local variable, directly.
